Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

satelettronica

01 - Self-diagnosis

1 - Self-diagnosis function

1.1 - Self-diagnosis function

The automatic gearbox is controlled electro-hydraulically.

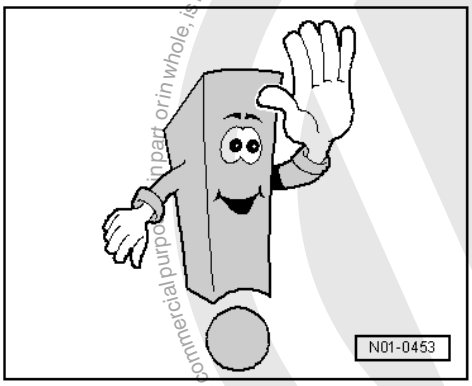
The term "self-diagnosis" is specifically for the electronic/electric control.

Always perform a self-diagnosis before the fault search.

Additional information

- Workshop Manual Polo 1995 ▸, Automatic gearbox 001
- "Current flow diagrams, Electrical fault finding and Fitting locations" binder, Polo 1995 ▸"
- Self-study programme No. 176.

1.2 - Data bus



Vehicles with data bus (from 10.99 ▸)

A data bus is fitted in every vehicle from 10.99 with one exception.

Exception: The gearbox EAW for the Japanese market. Communication with the engine control unit is generated via single wires.

Comprehensive information on the "data bus" is given in self study programme No. 186.

Advantages:

- Rapid data transfer between the control units
- Less wiring in vehicle

The automatic gearbox control unit sends signals into the data bus and uses signals from it. It exchanges signals (information) with other control units.

Examples of signals from data bus (sent by engine control unit)

- Accelerator pedal position (throttle valve position)
- Kickdown
- Engine speed

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

- Engine torque

Examples of signals into data bus (used by engine control unit)

- Cruise control system
- Ignition timing influences

Not only does the engine control unit exchange data with other control units, the other control units exchange data with each other via the data bus, as in this example.

For example, the dash panel insert with diagnostic interface for data bus -J533- (or -J285-) receives the speed signal via the data bus from the automatic gearbox control unit.

It is often the case that other systems can be coded. If they are incorrectly coded, faults often occur which do not have their origin in the automatic gearbox although a fault is stored in the fault memory of the automatic gearbox control unit.

If the automatic gearbox control unit detects that signals are missing or faulty, the data bus itself, another system or a component of another system may be defective.

Therefore, always perform self-diagnosis of affected control units.

When using the current flow diagram to check the routing of wiring, please ensure that the data bus wiring is okay.

Safety functions of gearbox control unit

The automatic gearbox control unit -J217- receives information from components that effect selection of gears and passes the information on to the valve body solenoid valves which via hydraulic switching control the switch elements.

Control units up to 09.99 feature two programmes to allow different driving styles: sporty ("SPORT" programme) or economical ("ECO" programme).

This two programmes are switched by the control unit automatically.

The control unit is equipped with a fault memory so that in the event of an electronic/electrical component failure or on open circuit the fault can be determined quickly. Fault are recognized by electrical signals and stored in the fault memory.

Control unit -J217- with driving situation gear changes (Fuzzy Logic) from 10.99

Determining the driving situation and driving resistance dependent gear change point happens automatically.

Advantages:

- Gear changes will be consumption orientated
- Maximum engine output is always available
- Individual adaption of gear change points in all driving situations

Gearbox control unit fault recognition

The control unit recognizes faults during vehicle operation and stores them in a fault memory => Fault tables, from page 10

After analysing the information the control unit distinguishes between sporadic faults and faults present at this moment (static) and stores these.

If the fault is not present for a predetermined time or when driving over a longer distance, it is no longer recognized and becomes a sporadic fault.

A fault is also changed to a sporadic fault when the fault memory is not erased after repairs.

Protected by copyright. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or assume any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Volkswagen AG

Sporadic faults will be displayed as "sporadically occuring faults" when the fault memory is interrogated.

If the sporadic fault is not present for a predetermined time or when driving over a longer distance, the fault is erased in the fault memory.

Fault memory on vehicles up to 09.99

The control unit fault memory is a "volatile memory". Faults stored are erased when the control unit is not supplied with a current. If the control unit connection or the vehicle battery is disconnected for a longer period, the fault memory is empty after approx. 1 hour. Faults present will then be recognized again when driving next.

Fault memory on vehicles from 10.99

Faults remain saved even if control unit has no power supply.

Safety functions of gearbox control unit

If faults occur whilst driving, the control unit can activate supplementary functions or an emergency running programme. They can affect the quality and function of the gear changes.

In emergency running, the 3rd and reverse gears can be selected using the gear shift lever.

On vehicles from 10.99, the first gear can also be selected using the gear shift lever.

If the fault occurs in "P", "N" or "R" then the emergency running mode for "P", "N" or "R" is activated.

The gearbox will remain in emergency running mode; until the fault is no longer recognized by the control unit over a predetermined period.

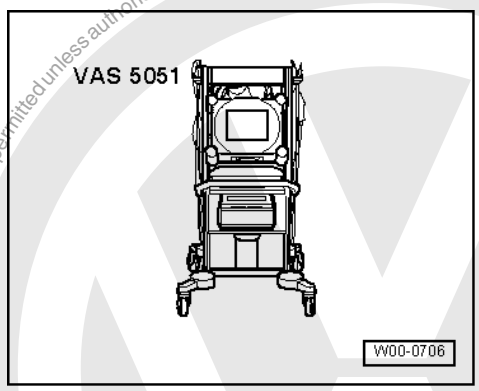
Faults which may lead to emergency running:

Open circuit in wiring, short-circuit, electrical or hydraulic components defective.

Renewing control units

If control units are renewed, the system must be put into the basic setting => Page 16 , Initiating basic setting.

Fault reader V.A.G 1551 and tester VAS 5051



Electrical faults that affect vehicle performance can be determined with these devices.

Functions which can be performed using this test equipment in self-diagnosis mode => page 9 , list of selectable functions.

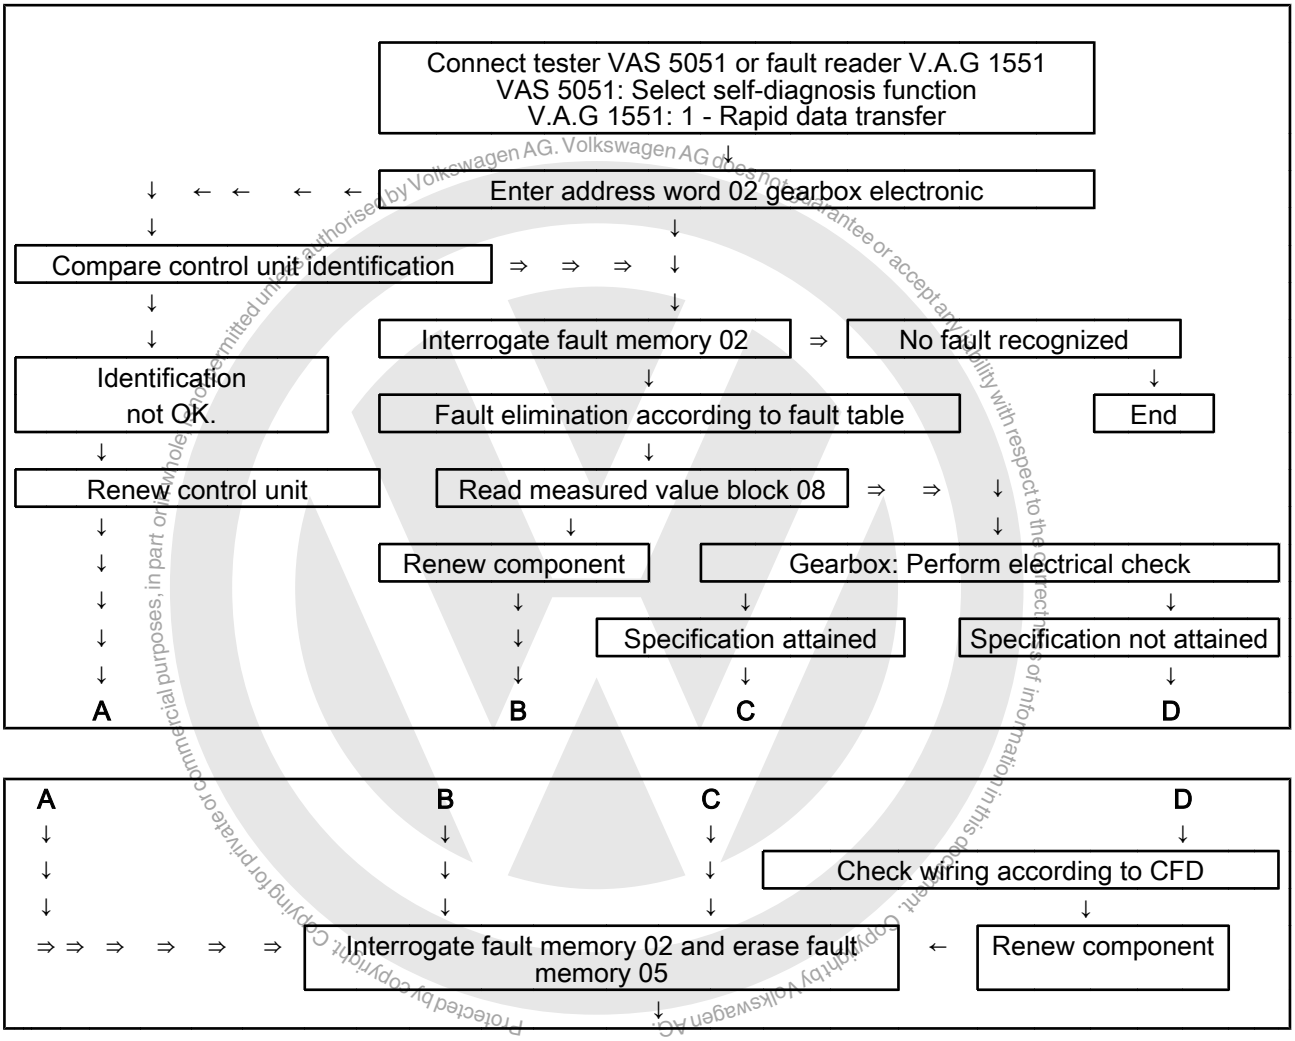
satelettronica

1.3 - Technical data of self-diagnosis

Memory	
-Non-volatile memory - Volatile memory	from 10.99 up to 09.99
Data output	
- Rapid data transfer - Flash code output	yes no
Data transfer between control units via: - single wires	up to 09.99
- Data bus Exception: 001 927 749 M => Page 8 , control unit identification	from 10.99
Final control diagnosis	no
Basic setting	yes
Coding control unit	no
Reading measured value block	yes

1.4 - Self-diagnosis - Guide for automatic gearbox



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

satelettronica

Initiate basic setting 04
(only initiate when the basic setting requests it)

↓

Carry out a road test and
interrogate fault memory 02 again

↓

If "no fault recognized !" is indicated on display
the self-diagnosis is completed

If after completing the self-diagnosis the automatic gearbox continues to operate with faults, then continue fault finding using fault finding programme.

=> "Fault finding" binder. Power transmission; No. 14

2 - Performing self-diagnosis

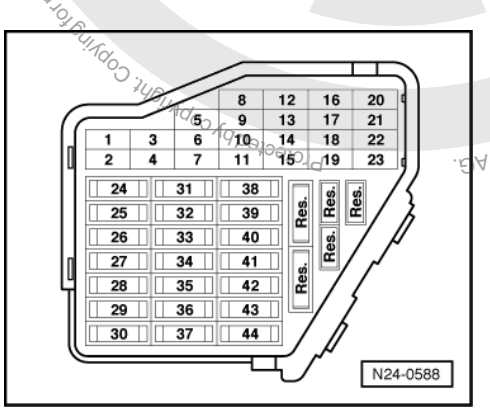
2.1 - Performing self-diagnosis

2.2 - Safety precautions

Note!
◆
◆

Test conditions:

- Selector lever in position "P" and handbrake applied.



- Vehicle voltage supply in order.
- Fuses No. 14, 21, 25, 29 and 33 OK.
- Fuses OK according to current flow diagram
- Fuses in main fuse box OK.
- Check earth connections for gearbox:

- Check earth connections for corrosion and poor contact; repair if necessary.
- Earth connection point is located below battery.
- Check battery earth strap and earth strap between battery and gearbox.

Copyright by Volkswagen AG. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica

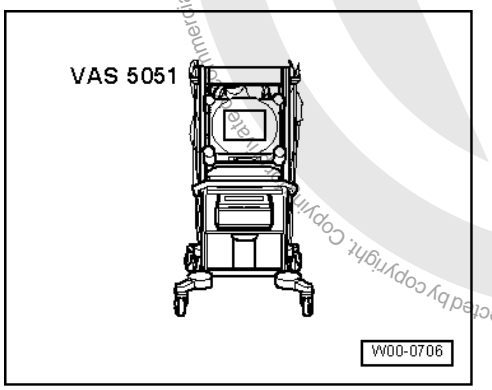
2.3 - Locations of diagnosis connections

The vehicle could have the diagnosis connection in a number of places depending on the year of manufacture. A clear indication of where the connection is located can be found in workshop manual

=> Automatic gearbox 001; Repair group 37; Location of diagnosis connections Location of diagnosis connections

All functions which could previously be performed with V.A.G 1551/1552 can also be performed with the new tester VAS 5051 in the operating mode vehicle self-diagnosis:

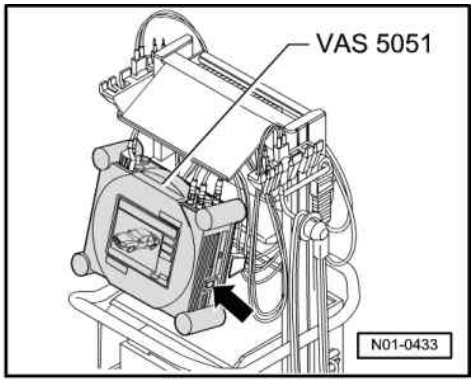
2.4 - Connecting vehicle diagnosis, testing and information system VAS 5051



Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- VAS 5051 Vehicle diagnosis, testing and information system

- Connect diagnosis cable connector VAS 5051/1 or VAS 5051/3 to diagnosis connection.



- -> Switch on tester -arrow-.

Now the tester requires approx. 5 minutes to run up.

- Switch on ignition.
- Select the zone "Vehicle self-diagnosis" on touch screen.

The display will now guide you further.

satelettronica

2.5 - Connecting fault reader V.A.G 1551 and selecting functions

Additional information

- Workshop Manual Polo 1995 ‣, Automatic gearbox 001
- "Current flow diagrams, Electrical fault finding and Fitting locations" binder, Polo 1995 ‣"
- Technical service handbook
- Parts catalogue

- With ignition switched off, connect fault reader V.A.G 1551 using diagnosis cable V.A.G 1551/3.

-> Indicated on display:

```
V.A.G - SELF-DIAGNOSIS      HELP
1 - Rapid data transfer1)
2 - Flash code output1)
```

1) appears alternately

- Additional operating instructions can be called up by pressing the HELP key of V.A.G 1551.
- The ⇒ key is used for advancing within the programme sequence.

=> Fault reader V.A.G 1551 operating instructions.

2.6 - Automatic test sequence

The automatic test sequence interrogates all the fault memories of the control units.

- Before selecting the gearbox control unit, perform the automatic test sequence. Faults of other control units can influence the gearbox control unit.
- Switch on ignition.

-> Indicated on display:

```
V.A.G - SELF-DIAGNOSIS      HELP
1 - Rapid data transfer1)
2 - Flash code output1)
```

1) Is displayed alternately

- Press key -1- for "Rapid data transfer" operating mode.
- Switch on printer with the Print key (indicator lamp in key lights up).

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Press key -0- twice; 00 enters the "Interrogate automatic test sequence" function.
- Confirm entry with Q key.

Then all control unit identifications, together with entries which may be in fault memory, are displayed.

- After test sequence, the V.A.G 1551 returns to the following start position:

-> Indicated on display:

```
V.A.G - SELF-DIAGNOSIS      HELP
1 - Rapid data transfer1)
2 - Flash code output1)
```

1) appears alternately

Copyright by Volkswagen AG. Protected by copyright. Copyright by Volkswagen AG. Not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Select automatic gearbox control unit

- Switch on ignition.
- Switch on printer with the Print key (indicator lamp in key lights up).
- Press key 1 for "Rapid data transfer" mode.

-> Indicated on display:

```
Rapid data transfer      HELP
Enter address word XX
```

- Press keys 0 and 2. (Enter the address word "gearbox electronics" with 02.)

-> Indicated on display:

```
Rapid data transfer      Q
02 Gearbox electronics
```

- Confirm entry with key Q.

-> Indicated on display:

```
001927749C     AG4 Gearbox     001
2009 □
```

The control unit identification, the coding and the dealership number of the V.A.G 1551 are displayed:

Example for control unit identification

Depending upon build level (programme level) the control unit can indicate a different control unit identification, to that shown in the example. Allocation of control unit => Parts catalogue.

- 001927749C: Part No.
- AG4 Gearbox 001: 4-speed automatic gearbox 001
- 0004: EPROM (programme level)

  The program level can also be read out in a measured value block.

- Coding 00000: is not required at present.
- WSC 00000: V.A.G 1551 dealership number with which the last coding was performed.

-> Indicated on display:

```
Control unit does not answer!      HELP
```

- By pressing the HELP key, a list of possible fault causes is printed out.
- After eliminating the possible causes of faults, again enter the address word 02 for "gearbox electronics" and confirm.

If "Control unit does not answer!" again appears:

-> Indicated on display:

```
Control unit does not answer!      HELP
```

Check control unit voltage supply.

- Perform test step 1 => Page 27 , Electrical check.
- Check wiring connections to diagnostic sockets

=> "Current flow diagrams, Electrical fault finding and Fitting locations" binder, Polo 1995▸.

- => Fault table, page 10 under fault code 65535 control unit faulty!
- Press ⇒ key.

-> Indicated on display:

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

```
Rapid data transfer       HELP
Select function XX
```

- After the HELP key is pressed, a list of the possible functions is printed out.

2.7 - List of selectable functions

	Page
01 - Interrogate control unit version => Performing self-diagnosis	7
02 - Interrogate fault memory	9
04 - Initiate basic setting	16
05 - Erase fault memory	15
06 - End output	
08 - Read measured value block	17

Further functions, which can be printed out by pressing the HELP key, need not be considered.

- After interrogating a function the V.A.G 1551 returns to the following start position:

-> Indicated on display:

```
Rapid data transfer       HELP
Select function XX
```

2.8 - Interrogating fault memory

- Connect fault reader V.A.G 1551 and enter address word "02 Gearbox electronics" and advance until "Select function XX" appears in the display => from page 7 .

-> Indicated on display:

```
Rapid data transfer       HELP
Select function XX
```

- Press keys 0 and 2. (The function "Interrogate fault memory" is selected with 02).

-> Indicated on display:

```
Rapid data transfer      Q
02 - Interrogate fault memory
```

- Confirm entry with key Q.

-> The number of stored faults or "No fault recognised" appears in the display.

```
X Faults recognised!
```

Output on printer V.A.G 1551	
No fault recognised!	If "No fault recognised" appears after performing repairs, the self-diagnosis is completed. In the event that the automatic gearbox does not operate properly despite self-diagnosis, carry out repairs as per fault finding programme. => "Fault finding, Power transmission" binder, No. 14

The stored faults are displayed in turn and printed out.

- Press ⇒key.
- After the last fault has been displayed and printed out, the faults should be rectified as described in the fault table => from page 10 .

Protected by copyright. Copyright by Volkswagen AG. Copying for private and commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica

- Press ⇒ key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

After interrogating the fault memory and rectifying the faults:

- Erase fault memory => Page 15

3 - Fault table

3.1 - Fault table

Selector lever lock solenoid -N110- Short to earth1) Open circuit/short to positive1)	Wiring open circuit or short to earth Selector lever lock solenoid -N110- defective	- Read measured value block =>Page 17 ; display group number 004
01312 Drive train data bus defective1) no communication1)	Data bus wiring/connectors defective	- Check data bus wiring and connectors using current flow diagram

1) One of these displays appears in addition to relevant component.

Output on printer V.A.G 1551	Possible cause of fault	Rectifying fault
01314 Engine control unit No communication Wrong equipment 1)	Data bus wiring/connectors defective Fault in system: Engine If the engine control unit can be coded, an incorrect code has been used	- Check data bus wiring and connectors using current flow diagram Check engine control unit => Repair group 01 for relevant engine code
01316 Brake control unit No communication	Data bus wiring/connectors defective Fault in system: ABS	- Check Data bus wiring and connectors according to current flow diagram Check ABS control unit => Repair group 01 for relevant ABS system

1) One of these displays appears in addition to relevant component.

V.A.G 1551 print-out (=> Page 10)	Possible cause of fault	Rectifying fault
65535 Control unit defective	 Control unit -J217- defective	- Renew control unit => Automatic gearbox 001; Repair group 37; Electrical/electronic components and locations; Components in vehicle Electrical/electronic components and locations; Components in vehicle - Initiate basic setting =>page 16

The control unit -J217- should not be renewed until the possible cause of the fault has been determined and the following faults have been rectified:

- mechanical faults
- hydraulic faults
- all affected electrical/electronic components and cable connections.

=> Automatic gearbox 001; Repair group 37; Electrical/electronic components and locations; Components in vehicle Electrical/electronic components and locations Components in vehicle

and the system has been reverted to its basic setting

=> page 16 .

4 - Erasing fault memory

4.1 - Erasing fault memory

Requirement:

- Fault memory interrogated => page 9 .
- Vehicle stationary.
- Engine speed not above 960 rpm.

After fault memory has been interrogated:

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Press keys 0 and 5. (The function "Erase fault memory" is entered with 05.)

-> Indicated on display:

```
Rapid data transfer      Q
05 Erase fault memory
```

- Confirm entry with key Q.

-> Indicated on display:

```
Warning!
Fault memory was not interrogated.
```

If the ignition was switched off e.g. between interrogating the fault memory and erasing fault memory, the fault memory is then not erased.

- Adhere strictly to the sequence of operations, i.e. first of all interrogate fault memory.

-> Indicated on display:

```
Fault memory is not erased
```

If one or more faults are present.

- Interrogate fault memory => Page 9 .

-> Indicated on display:

```
Rapid data transfer
Fault memory is erased!
```

(The fault memory will be erased approx. 5 seconds. after the display appears.)

The fault memory is now erased.

- End output => page 24 .

- Switch off ignition.

Wait about 1 minute before again interrogating the fault memory.

-> Indicated on display:

```
System cannot be interrogated!
```

-> Print out with printer switched on:

```
1 Fault recognized !
00811     3333
System cannot be interrogated
```

Protected by copyright. Copying for private, commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Control unit -J217- was not given sufficient time to recognize faults.

- Wait about 1 minute before again interrogating the fault memory.
- After interrogating and erasing the fault memory, carry out a test drive and again interrogate the fault memory.

When the fault memory is interrogated, the following display should appear:

"No fault recognized!"

5 - Initiating basic setting

5.1 - Initiating basic setting

The basic setting should be initiated after performing the following repairs:

- Exchanging engine
- Replacing or coding engine control unit
- Removing and installing gearbox
- Removing and installing "electronic accelerator"
- Replacing throttle valve potentiometer -G69-
- Altering throttle valve potentiometer -G69- setting e.g. when adjusting idling switch (engine)
- Removing and installing kick-down switch
- Replacing automatic gearbox control unit -J217-

- Read also:

=> "Special Information Bulletins" binder; Engine; No. 4

- Connect fault reader V.A.G 1551 and enter address word "02 Gearbox electronics" and advance until "Select function XX" appears in the display => from page 7 .

-> Indicated on display:

```
Rapid data transfer       HELP
Select function XX
```

- Press keys 0 and 4. (The function "Initiating basic setting" is selected with 04).

Accelerator pedal must remain in idling position.

-> Indicated on display:

```
Rapid data transfer       Q
04 - Basic setting
```

- Confirm entry with key Q.

-> Indicated on display:

```
Basic setting     HELP
Enter display group number XXX
```

- Press key 0, 0 and 0.
- Confirm entry with key Q.

-> Indicated on display:

```
System in basic setting      0
```

The system is now in the basic setting.

- Depress accelerator pedal as far as kickdown and hold in this position for 3 seconds.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

- Press key ⇒.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

6 - Read measured value block

6.1 - Read measured value block

Additional information

◆ "Current flow diagrams, Electrical fault finding and Fitting locations" binder, Polo 1995 ▸"

- Connect fault reader V.A.G 1551 and enter address word "02 Gearbox electronics" and advance until "Select function XX" indicated on display => from page 7 .

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Press keys 0 and 8. (The function "Read measured value block" is selected with 08.)

-> Indicated on display:

```
Rapid data transfer      Q
08 - Read measured value block
```

- Confirm entry with key Q.

-> Indicated on display:

```
Read measured value block
Enter display group number XXX
```

- Enter display group number => List of selectable display group numbers, page 17 .
- Confirm entry with key Q.

```
Read measured value block     1
□ 1    □ 2     3     □ 4
```

-> There are always 4 display zones in the measured value block (if necessary in physical quantities). Decoding the individual values in display zones 1 to 4 =>Test table page 18 .

List of selectable display group numbers

Indicated on display (example)

7 - End output

7.1 - End output

- Press keys -0- and -6-, this ends the output.

-> Indicated on display:

```
Rapid data transfer      Q
06 End output
```

- Confirm input with Q key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Switch off ignition.
- Disconnect connection to fault reader V.A.G 1551.

8 - Checking solenoid valves whilst driving

8.1 - Checking solenoid valves whilst driving

8.2 - For vehicles up to >09.99

- The solenoid valves can be checked whilst driving via "Read measured value block 08"; "Display group number 004". A second mechanic is required for the read out whilst driving.
- The table shows the activated solenoid valves -N88- and -N89- in each selector lever position. These solenoid valves control the switching elements to the relevant gears.
- The solenoid valve -N91- activates the lock-up clutch modulation valve.
- Solenoid valves -N90- and -N93- are valves which indirectly influence the switching to achieve a higher switch comfort.
  -N90- = Time delay valve,
  -N93- = Main pressure valve (not displayed in display group number 004).
- All solenoid valves are checked via self-diagnosis => Interrogating fault memory, page 9 .
- V.A.G 1551 display zone 4 has 8 digits (Example: 01000011).
- Only positions 1, 7 and 8 are of importance.

Example: Selector lever position "P" - Displayed on V.A.G 1551 Display group number 04 - Display zone 4:							
Position 1	Position 2	Position 3	Position 4	Position 5	Position 6	Position 7	Position 8

satelettronica

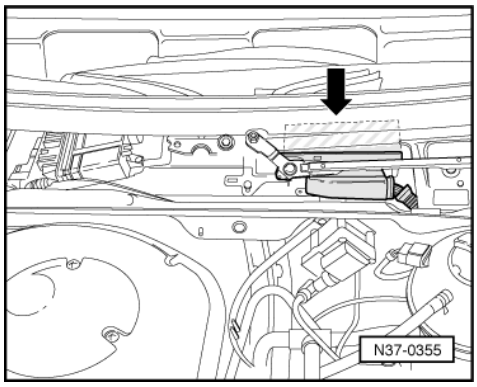
Additional information required

- Workshop Manual Polo 1995 ▸, Automatic gearbox 001
- "Current flow diagrams, Electrical fault finding and Fitting locations" binder, Polo 1995 ▸

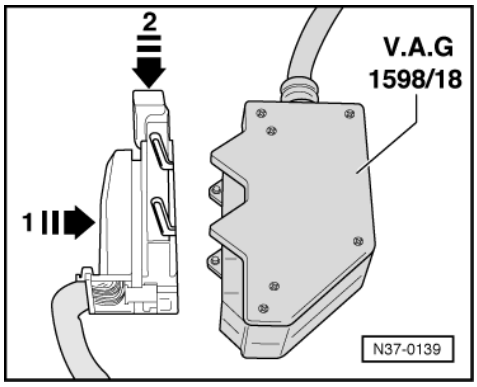
Test requirements:



- Battery voltage in order.
- Vehicle voltage supply in order.
- Fuses in main fuse box OK.
- Fuses No. 14, 21, 25, 29 and 33 OK.
- Check earth connections for gearbox:

-> The gearbox control unit (arrow) is located in the plenum chamber.

- Check earth connections for corrosion and poor contact; repair if necessary.



- Earth connection point is located under battery.
- Check battery earth strap and earth strap between battery and gearbox.
- Switch ignition off, release multi-pin connector and pull off control unit.
- -> Fit test box V.A.G 1598/18 onto multi-pin connector (1) and lock, in direction of arrow (2).

Using test box V.A.G 1598/18 the wiring can be checked according to current flow diagram.

- Before connecting the test leads the correct measuring range on tester must be adjusted. Otherwise the electronic components can be destroyed !

- Use the hand multimeter V.A.G 1526 with auxiliary cables from V.A.G 1594 for testing.
- The specified values are valid for an ambient temperature from 0 °C...40 °C.
- If the readings obtained differ from the specified values, determine fault on the basis of the current flow diagram.
- If the readings obtained differ only slightly from the specified values, clean sockets and connectors of the testers and test leads and repeat test. Before replacing the particular components, test wiring and connections and, particularly if specified values are below 10 ω, repeat resistance measurement on component.

satelettronica

10 - Definitions

10.1 - Definitions

These explanations refer only to this assembly group: Self-diagnosis for automatic gearbox 001. These definitions are not necessarily generally valid.

Further information on this subject can be found in

- Self-study programme No.176.
- Workshop Manual Lupo 1999 ▸, Automatic gearbox 001

ABS

Anti-locking brake system. Further information on the ABS can be found in the relevant self-study programmes.

ATF (Automatic Transmission Fluid)

Gearbox oil for automatic gearbox

Display zone => Read measured value block

Display group number => Read measured value block

Throttle valve potentiometer

An engine component. The "throttle valve signal" originates from here.

Self-diagnosis

The capability of the control unit:

to recognise faults,

to react to faults,

to store faults,

to register faults and make them available in the measured value block.

Performing self-diagnosis

Connecting the fault reader to be able to interrogate the fault memory.

Performing electrical check

A targeted check of the electronic components by performing certain measurements.

Electronic power control (EPC)

Terms like: EPC, electronic accelerator, accelerator module and electric throttle operation all refer to this component. Among other things, senders -G79- and -G185- and a throttle valve positioner are housed within.

EPC is always a component of engine control and thus communicates initially with the engine control unit. Because when doing this, for example, the signal for the kickdown switch is also generated, the engine control unit stores the data in the data bus, in order that other control units have access to it.

Further information on this subject can be found in

- Self-study programme no. 210.

Throttle position sender

=>Electronic power control (EPC)

Gearbox speed sender -G38-

The sender records the speed of -K3- and transmits it to the automatic gearbox control unit.

Road speed sender -G68-

The sender records the speed of the output gear and transmits it to the automatic gearbox control unit (not to the speedometer).

Initiating basic setting

The values learnt in the control unit are turned back to the initial values.

No communication

There is no connection for exchanging information between the control units.

Kickdown switch -F8-

The kickdown switch is integrated into the accelerator cable. When the accelerator pedal is depressed fully onto its stop the gearbox changes down for acceleration.

Short to earth

Current flows -incorrectly- to earth without supplying a consumer.

Short to positive

Current flows -incorrectly- to a live component without supplying a consumer.

Wiring

Routing of electrical wiring and components in vehicle.

Selector lever lock magnet N110

Located in the selector mechanism close to the selector lever. Prevents movement (involuntary) of the selector lever from positions "P" and "N" as long as the brake pedal is not depressed.

Solenoid valves

Opens and closes the oil channels to the clutches and brakes.

Read measured value block

The control unit can transfer a considerable amount of test data. This test data delivers information on the operational condition of the system and/or sensors connected to it. In many cases the transferred test data supports fault finding and fault rectification. The test data has been summarized into single display groups because all the information cannot be evaluated at the same time. The information can be selected via display group numbers.

(If you can only select a two character display group number, you have an old programme card in your V.A.G 1551 ! Replace the card with a valid version).

Each display group number is displayed on the fault reader as four display zones.

A display zone can be displayed as an eight digit row or as values. These values are sometimes displayed with a measurement symbol.

satelettronica

Emergency running

"Condition of the control unit" when certain faults are recognised in order to maintain driving safety, to protect the gearbox against damage and at the same time to ensure that driving characteristics are impaired as little as possible.

Pendulum support

Designation for a part of the assembly mounting.

Programme card version

Always use the most up-to-date programme card. Further information can be found in the test unit operating instructions.

Sporadic

Happens occasionally

Stationary uncoupling

The gearbox shifts into neutral hydraulically when the vehicle is stationary.

Static

Present at the moment, continuous

TDC signal

The signal is used to calculate the engine speed.

Infinity ω

The resistance is infinite, open circuit.

ω = Ohm

TCC (Torque converter lock-up clutch)

Transfers the engine torque mechanically to the gearbox.

Ignition timing control

The engine torque is reduced during the gear shift process by altering the ignition timing.
